Project Aspect	Level 1 – Component	Level 2 – Product	Level 3 – System	Level 4 – Environment
Energy efficiency	Efficient LED driver components reduce electrical losses	LED lighting system consumes less power	Lower energy demand from electricity grid	Reduced carbon emissions from power generation
Materials	Copper and aluminium components designed for recycling	Modular product design allows component replacement	Supports circular economy practices	Reduced raw material extraction
Product lifespan	Durable electronic components	Long lifespan LED lighting system	Reduced waste generation	Lower environmental impact over time
Recycling	Components can be separated for recycling	Product designed for disassembly	Materials returned to manufacturing cycle	Resource conservation

Question	Application to Project
Does the design reduce environmental impact?	Yes, energy consumption is reduced using efficient LED technology.
Can materials be reused or recycled?	Yes, copper and aluminum components can be recycled.
Does the design improve system efficiency over time?	Yes, improved LED drivers and power electronics increase efficiency.
Does the project support long-term sustainability?	Yes, long lifespan and repairable components reduce waste and resource use.
